

**Model 7030-U Outboard
Motor Cylinder - unbalanced**

Assembled

Unassembled

This cylinder is constructed of bronze, brass and stainless steel. It has a 1 1/4" inside diameter, 8" stroke, and a two piece cylinder rod for ease of installation in tight situations. It is designed to be screwed to steering tube on outboard motors and sterndrives. The top picture shows the cylinder with the two piece rod assembled. The rod pieces screw together and are pinned to assure a secure fit. Please be aware that using this cylinder alone will cause uneven amount of turns from straight ahead to starboard and straight ahead to port because of its unbalanced design.
